

PEASHOLM DENTAL PRACTICE

Facial Rejuvenation Patient Information

Facial Rejuvenation involves using methods other than surgery to enhance your appearance and soften the effects of ageing. Different techniques involving the use of Botulinum Toxin and Dermal Fillers can be a really effective yet subtle way to tweak those little imperfections

Discrete methods of aesthetic enhancing
with dramatic improvements!

Both the Injectables and Fillers have a high margin of safety, having been used within the Medical Profession for over 25 years. All the products used

PEASHOLM

DENTAL PRACTICE

within the practice are completely dissolvable, so no permanent products such as Silicone are ever used. The effects of injectionables can last from 4-6 months with the results of fillers lasting up to a year.

Both these techniques involve gently and carefully injecting a tiny amount of the required product into the desired area to achieve a favourable result.

The technique itself is not uncomfortable as very thin short needles are used, but local anaesthesia will be used if required. All treatments are completed in a clinical setting which is CQC approved.

You.....Only Better!

The areas of the face that may benefit from such treatments include worry and frown lines, crows feet or wrinkles under the eyes. Softening and smoothing these areas instantly gives the face a fresh look. The eyebrow can also be raised and the eyes given a more opened look, reducing the appearance of sagging or heavy upper eyelids. Tear troughs, the deep indentations that can appear under the eye, can also be dramatically reduced with dermal fillers.

The shape of your lips can be enhanced and fullness refined, along with improving the angles of the mouth. "Smokers lines" or pursing lines of the top line can also be smoothed. Often a combination of injectables and fillers works well for these areas.

The area from the nose down to the mouth is an area particularly prone to creasing as we age, folds can occur and the face can look heavier as a result. Fillers can be gently injected into these areas to help soften the creasing and instantly rejuvenate you. Frowning from the mouth down to the chin can also

PEASHOLM DENTAL PRACTICE

benefit from the same treatments. These can help lift the corners of the mouth to reduce unsightly downward smile lines.

Creasing, muscular banding and sagging of the neck, jowls and chin too can benefit from the use of injectionables, and can help improve the contour and evenness of this wrinkle prone area. These methods can be used in isolation or in combination with cheek fillers, to enhance the overall profile of the face.

These products also work wonders under the arms to prevent excessive and often socially uncomfortable sweating from the armpits. This is completed with very shallow small injections so discomfort is kept to a minimum.

Injectionables and Fillers can be used for a wide range of treatments in both men and women of all ages, please contact the practice for further information or to arrange your personal consultation with Emma Skipper or Katie McCarthy.
