

FREQUENTLY ASKED QUESTIONS

What is Botulinum Toxin and is it Safe?

Botulinum Toxin is a purified protein produced by a type of bacterium. It has been used for over 25 years for cosmetic and medical treatments. Injected directly into facial muscles in tiny amounts it is very safe.

How does the Toxin work?

The toxin works by blocking transmission of nerve impulses to the muscles injected. This makes the muscles appear less strained and can mean that lines and wrinkles soften.

How long does it take?

The treatment itself does not take too long, usually under 30 minutes, but it can take up to 2 weeks before the true full effect is seen. With Dermal Fillers the results can often be seen instantly.

How long does it last?

Everyone is different, but the injectable anti-wrinkle treatments usually last 3-6 months, improving with the number of treatments you have, and the Fillers can last up to 18 months.

Can I go back to work after?

You can, but often after treatment you can look a little red and maybe bruised in some areas, so you may prefer not to return to work that day.

PRICE LIST

BOTULINUM TOXIN

Sites include: Forehead, Frown lines, Crow's feet, Neck, Gummy Smiles, Smokers Lines and Lower face (jowls)

One site	from £149

NON-SURGICAL FACIAL REJUVENATION

**A comprehensive guide
to non-surgical anti-ageing
treatments to make you
look as good as you feel...**

We all get older and sometimes we need a helping hand to combat Mother Nature. This is where injectables and fillers can help.

EYES (CROW'S FEET)

Treatment in this area aims to smooth out crow's feet and laughter lines with Botulinum Toxin.

This can help make the eye appear more open and reduce that tired look. Crows feet can also be treated with other areas of the upper face, to reduce the appearance of heavy eyelids.

LIPS

With the use of Dermal Fillers we can enhance the shape and fullness of your lips. A combination of Botulinum Toxin and Dermal Fillers can be used to reduce the appearance of smoker's lines and improve your smile line, especially if your lip thins on smiling.

FOREHEAD

Often the most noticeable features of ageing include worry and frown lines. Smoothing out these areas, using injectables, can help achieve a more youthful look.

This method of treatment can help raise the brow without the need for surgery, thus reducing the appearance of heavy upper eyelids.

MID FACE

As we age, creases become more prominent giving us an older appearance. Dermal fillers can safely be used to soften these lines and instantly give a more rejuvenated appearance. This works miracles for under eye circles, making us look less tired.

The cheeks too can be enhanced and plumped, to achieve a fresh faced look.

NECK

With age the Neck can become thin and stretched, or can appear to sag in places. Small injections of Botulinum Toxin into these areas can help regain the neck's youthful look

ARMPITS

Use of Botulinum toxin in this area is very effective in the reduction of excessive sweating (hyperhidrosis). This simple quick procedure can often mean that antiperspirant is no longer required.
